

Front End Development

UI Elements

Search box

- When a user selects the search box, a keyboard must appear allowing user to input text. That text needs to be recorded at "Enter" press

Qs

- Are we giving user locations, or are we pre-loading the app with a list of places the user can choose from. If so, how are we designing that?

Map image

- A user should be able to see a map of campus upon opening the app.

Qs

- How are we transitioning from outdoor views of campus to indoor?

- How/where are we storing the imagery for the campus and buildings?

- Are we expecting the screen to move with the user, or be static (as in, will it be zoomed in and move actively with user or a zoomed out still)?

- How many images do we need between outdoor and indoor?

- When zooming in, how do we preserve integrity of visual (pixels don't get blurry while zooming)?

User location

- User should be able to identify their location on the map at a glance

Qs

- How accurate will this be?
